DATABASE PROJECT

DISTRIBUTION LIST GENERATOR

A DISTRIBUTION LIST GENERATOR IS A TOOL USED BY STAFF MEMBERS TO CREATE LISTS OF PEOPLE, NAMELY STUDENTS. THESE ARE USED FOR BULK EMAIL AND FOR ORGANIZATION.

PURPOSE

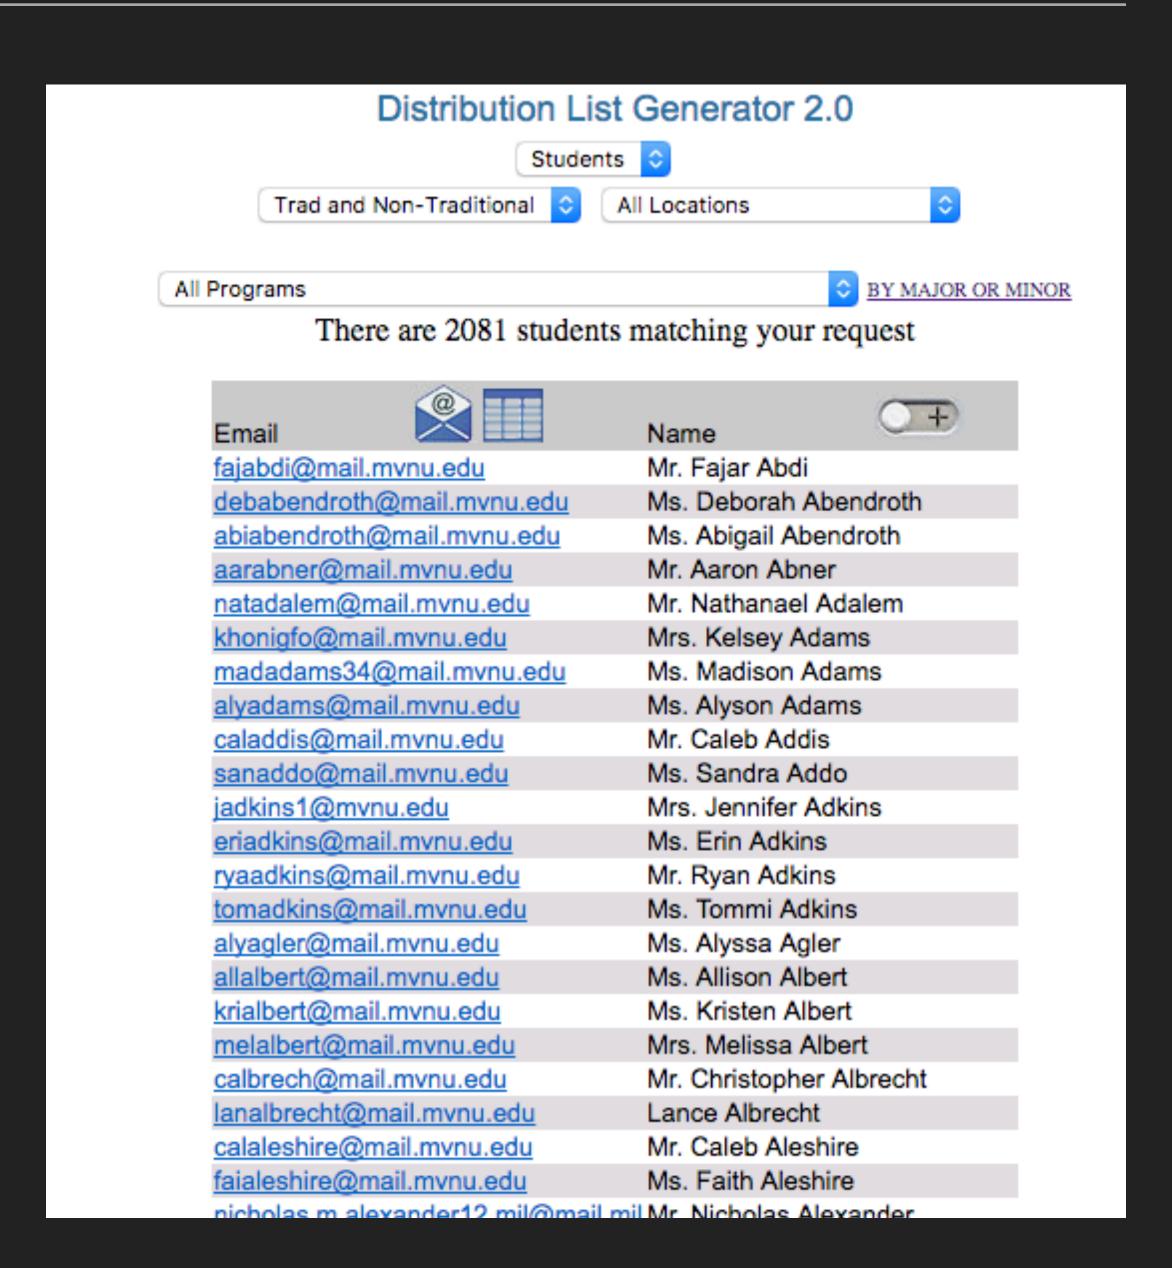

- To build a better distribution list generator, faster and with more features
- MVNU already has one, but I think it's very slow and dated-looking
- There isn't a way to organize clubs or sports teams
- No ability for custom lists

CHALLENGES

- Complex SQL queries became an issue
- Couldn't figure out a clean way to provide some features without a front end framework
- I ran out of time, quickly

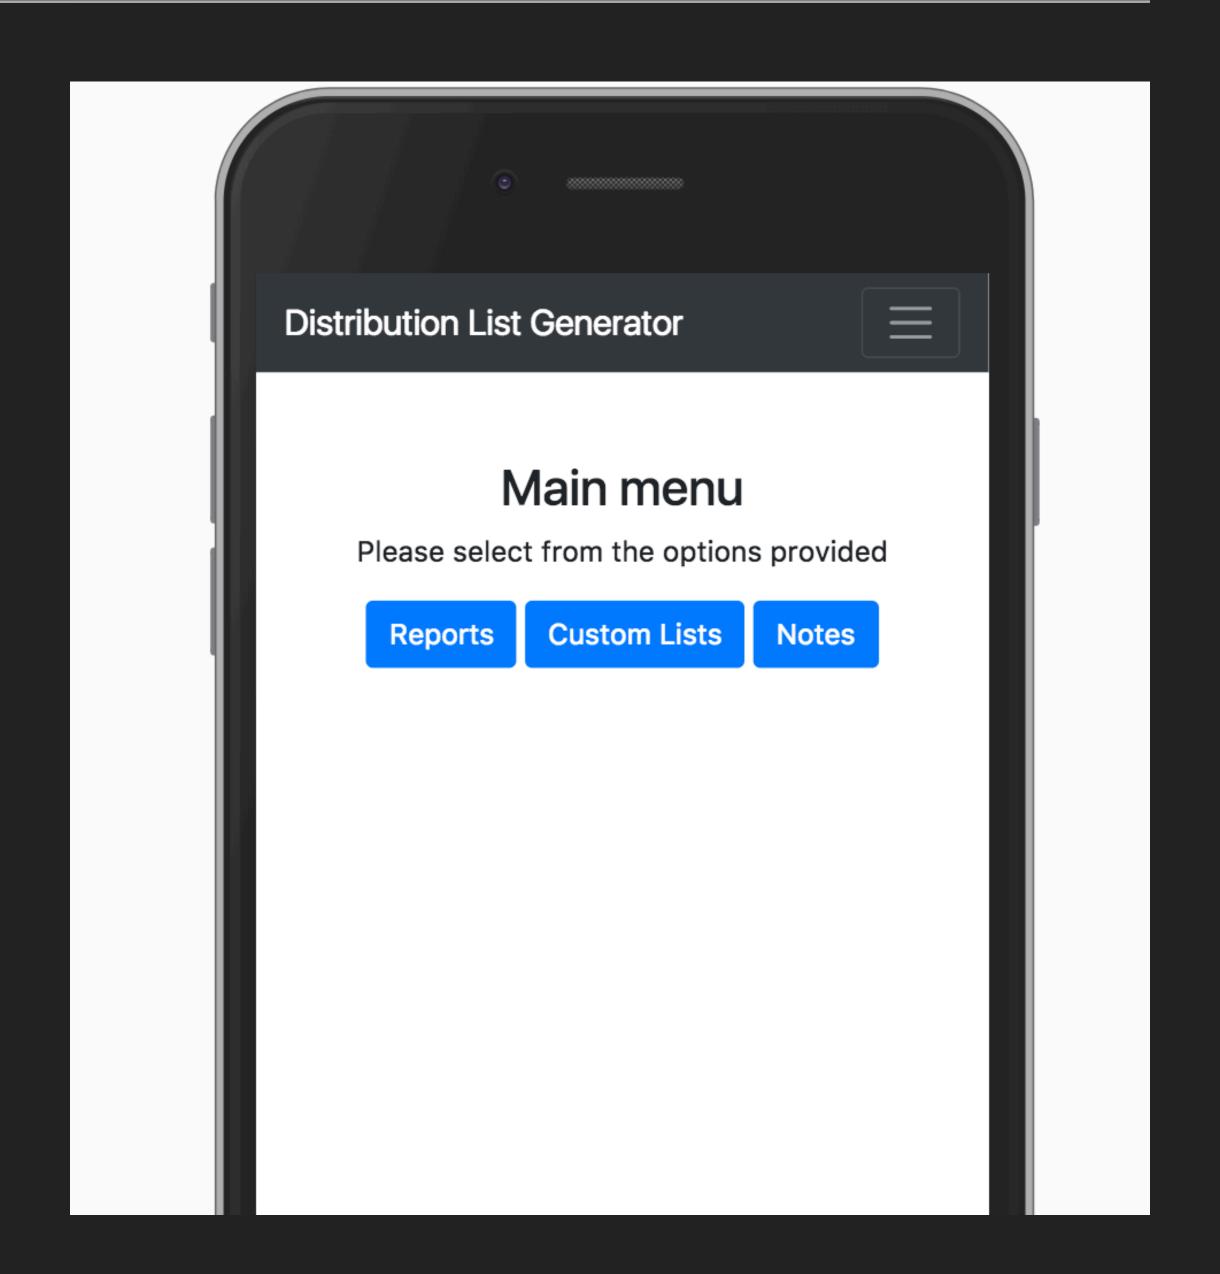

MVNU'S DISTRIBUTION LIST GENERATOR

- Dated UI
- Load time: 27s
- Not responsive
- Relies on slow MSSQL database

MY PROJECT

- Modern Bootstrap UI
- Load time: 607ms
- Responsive (Except for tables)
- Relies on fast MySQL database

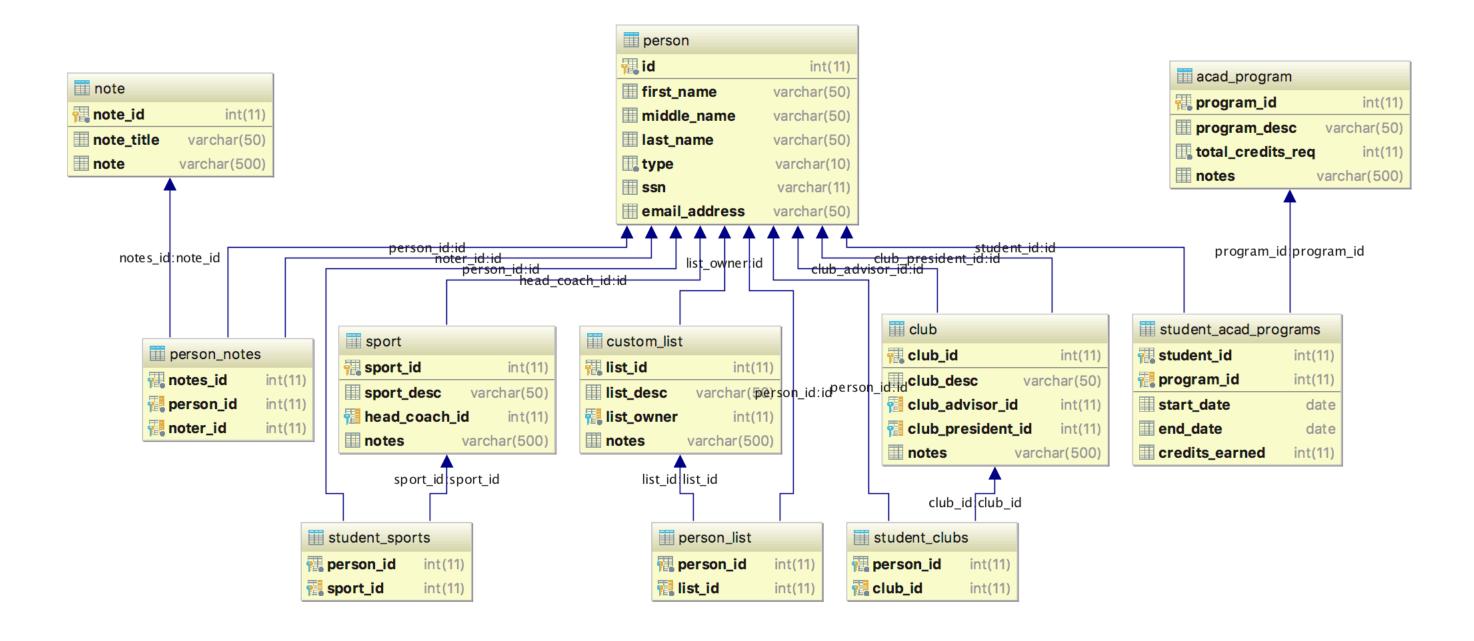

```
return reject(err);
12
         })
       })
13
14
15
     // Delete a custom list along with all members
16
     exports.deleteList = function(listId) {
17
        return new Promise((resolve, reject) => {
18
19
          database.execQueryWithParams(`DELETE FROM person_li
          .then((results) => {
20
            database.execQueryWithParams(`DELETE FROM custom_
21
22
            .then((results) => {
23
              return resolve(results);
           })
24
          })
25
26
          .catch((err) => {
27
            return reject(err);
         })
28
       })
29
30
31
32
     // Get all custom lists
     exports.getLists = function() {
33
        return new Promise((resolve, reject) => {
34
35
         database.execQuery(`
          SELECT custom_list.list_id, list_desc,
36
37
          CONCAT(first_name, " ", middle_name, " ", last_name
            COUNT(person_list.person_id) AS 'member_count'
38
39
          FROM custom_list
          LEFT JOIN person_list ON custom_list.list_id = pers
40
          JOIN person ON custom_list.list_owner = person.id
41
         GROUP BY custom_list.list_id
42
43
          .then((results) => {
44
```

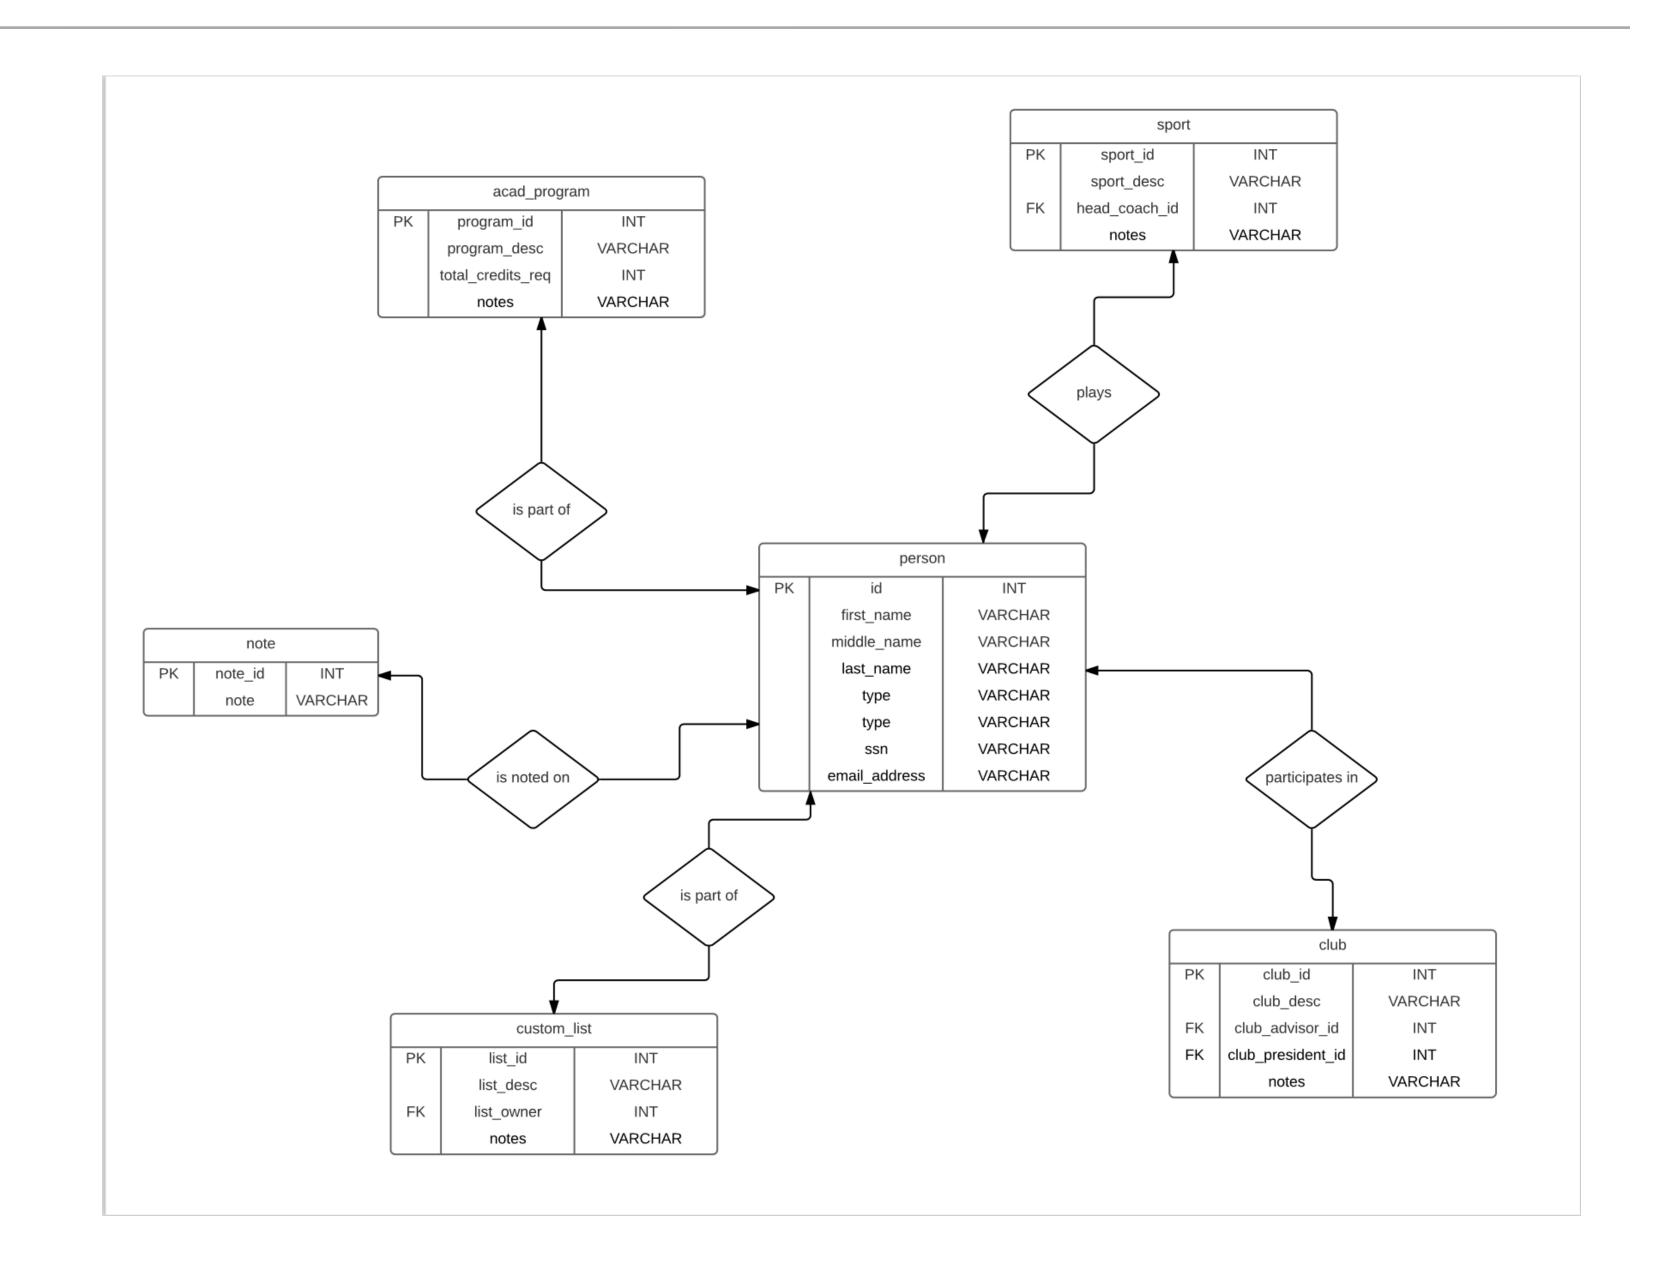

11

DATABASE

- Source of truth is 'person' table, lots of foreign key constraints
- It uses a many-to-many relationship, with cross-reference tables

ORIGINAL ER DIAGRAM

IMPLEMENTATION STACK

- Frontend: HTML/CSS/JS
- CSS: Bootstrap 4
- Backend: Node JS and Express
- Templating: Handlebars
- Database: MySQL 5.7
- Host: Digital Ocean
